The 2026 International Statistics Seminar

"Applications of Statistical Learning and Machine Learning in Multidisciplinary Research"

Program and Abstract Book

Institut Teknologi Bandung, 29 September 2026

PREFACE

It is our great pleasure and honour to welcome you to the **2026 International Statistics Seminar (ISS 2026)**, organised by the **Statistics Research Division, Faculty of Mathematics and Natural Sciences (FMIPA), Institut Teknologi Bandung (ITB), Indonesia**, in collaboration with the **Faculty of Computer and Mathematical Sciences (FSKM), Universiti Teknologi MARA (UiTM), Malaysia**.

With the theme **"Applications of Statistical Learning and Machine Learning in Multidisciplinary Research,"** ISS 2026 provides a forum for researchers, academics, practitioners, and students from different countries and disciplines to exchange ideas, share research findings, and explore recent developments in statistical learning and machine learning.

The rapid development of data science, artificial intelligence, and machine learning has created new opportunities for statistics to contribute to solving increasingly complex problems. At the same time, multidisciplinary research presents new challenges that require rigorous statistical thinking, innovative computational approaches, and meaningful collaboration across fields. ISS 2026 is therefore designed to highlight how statistical and machine learning methodologies can be translated into knowledge and practical solutions in diverse areas of research.

The programme brings together distinguished speakers and researchers from Indonesia and the international academic community, with presentations covering a wide range of applications, including medical diagnosis and healthcare, environmental problem solving, oil and gas equipment reliability, infectious disease analysis, spatio-temporal forecasting, sustainable computing, physics, geostatistics, and disaster risk assessment. This diversity reflects the central spirit of the seminar: **statistics and machine learning as powerful tools for understanding complex phenomena and supporting evidence-based solutions across disciplines**.

We sincerely hope that ISS 2026 will serve not only as a platform for presenting research, but also as an opportunity to establish new academic networks, initiate future collaborations, inspire young researchers, and strengthen international cooperation in statistics, data science, and machine learning.

We would like to express our deepest appreciation to all keynote speakers, invited speakers, session chairs, participants, supporting institutions, organising committee members, and everyone who has contributed to the successful organisation of this seminar. Your participation and support are essential to making ISS 2026 a meaningful academic gathering.

Finally, we invite all participants to actively engage in the presentations and discussions, exchange perspectives, and take advantage of this opportunity to learn from one another. May ISS 2026 foster new ideas, fruitful collaborations, and lasting contributions to the advancement of statistical learning and machine learning for multidisciplinary research.

Welcome to the 2026 International Statistics Seminar.
We wish you an inspiring, productive, and enjoyable seminar.

PROGRAMME

THE 2026 INTERNATIONAL STATISTICS SEMINAR
APPLICATIONS OF STATISTICAL LEARNING AND MACHINE LEARNING
IN MULTIDICIPLINARY RESEARCH

29 SEPTEMBER 2026 (TUESDAY)

TIME (GMT+7)	TENTATIVE PROGRAMME
08.00 – 08.10	**Registration**
08.10 – 08.15	**Welcoming Remarks** **1. Representative of FMIPA ITB** **2. Deputy Vice Chancellor (Research and Innovation), UiTM: Prof. Dr. Fazah Akhtar Hanapiah**
08.15 – 08.30	**Officiating Remarks and Official Opening** **Rector of ITB, Represented by Dean of FMIPA ITB: Aep Patah, Ph.D** Video Montage
08.30 – 08.55	**Session Chair 1:** Assoc. Prof. Dr. Wan Fairos Wan Yaacob (UiTM, Malaysia)
	Keynote Session **Speaker 1: Prof Dr. Kamarul Imran Musa** University Sains Malaysia, **Malaysia** *Intelligent Medicine, Imperfect Evidence: Machine Learning and Deep Learning from Bench to Bedside*
08.55 – 09.20	**Speaker 2: Prof. Dr. Sapto Wahyu Indratno** Institut Teknologi Bandung, **Indonesia** *Clustering of Medical X-ray Images via Mixture of Kernel-Based Gaussian Copulas*
09.20 – 09.45	**Session Chair 2:** Assoc. Prof. Dr. Syerina Azlin Md Nasir (UiTM, Malaysia)
	Speaker 3: Prof Dr. Marina Yusoff Universiti Teknologi MARA, **Malaysia** *Predictive Analytics for Equipment Reliability in Oil and Gas using AI Data-Driven Models*
09.45 – 10.30	**Speaker 4: Assoc. Prof Tim Seleznev** & **Speaker 5: Prof. Dr. Roman Dremliuga** Far Eastern Federal University, **Russia** *Computer Vision and AI Algorithms in Solving Environmental Problems* Sub-title: *Bridging Education and Industry: Teaching AI and Machine Learning Through Real-World Partner Projects from Year One*

TIME (GMT+7)	TENTATIVE PROGRAMME
10.30 – 10.40	**Break**
10.40 – 11.05	**Session Chair 3:** Dr. Maharani Ahsani Ummi (ITB, Indonesia)
	Keynote Session **Speaker 6: Prof Dr. Nazri Che Dom** Universiti Teknologi MARA, **Malaysia** *From Patterns to Prediction: Transforming Dengue Data into Actionable Insights through Statistical and Machine Learning*
11.05 – 11.30	**Speaker 7: Prof. Dr. Rabie A. Ramadan** University of Nizwa, **Oman** *Explainable Deep Learning for Medical Image Diagnosis*
11.30 – 11.55	**Speaker 8: Assoc. Prof Dr. Arief Gusnanto** University of Leeds, **United Kingdom** *Sparse Graph-Laplacian Non-negative Matrix Factorisation for Tumour Subtype Discovery from Copy Number Alteration Data*
12.00 – 13.30	**Lunch** Break
13.30 – 13.55	**Session Chair 4:** Dr. Yuli Sri Afrianti (ITB, Indonesia)
	Keynote Session **Speaker 9: Assoc. Prof Dr. Utriweni Mukhaiyar** Institute Teknologi Bandung, **Indonesia** *Hybrid GSTAR and Deep Learning Model for Spatio-Temporal Air Pollution Forecasting*
13.55 – 14.20	**Speaker 10: Assoc. Prof Dr. Azlan Ismail** Universiti Teknologi MARA, **Malaysia** *Deep Reinforcement Learning for Sustainable Cloud Resource Management: A Unified Perspective on Autoscaling, Task Scheduling and Simulation*
14.20 – 14.45	**Speaker 11: Assoc. Prof Dr. Monoj Kumar Muchahari** Assam Down Town University, **India** *Machine Learning in Disease Prediction: Fine-Scale Integrated Surveillance and Monitoring System*
14.45 – 15.10	**Session Chair 5:** Dr. Sandy Vantika (ITB, Indonesia)
	Speaker 12: Assoc. Prof Dr. Sparisoma Viridi Institut Teknologi Bandung, Indonesia *Conversational Pyhsics: LLM-Guided Simulation for Non-Programmers*
15.10 – 15.35	**Speaker 13: Dr. Tirivangani Magadza** Harare Institut of Technology, **Zimbabwe**

TIME (GMT+7)	TENTATIVE PROGRAMME
	Beyond the Architecture Race: Robust, Equitable Deep Learning for Brain Tumor Segmentation
15.35 – 16.00	**Session Chair 6:** Dr. Wan Zakiyatussariroh Wan Husin (UiTM, Malaysia)
	Speaker 14: Assoc. Prof Dr. Kurnia Novita Sari Institut Teknologi Bandung, **Indonesia** *3D Anisotropic Semivariogram Modeling Using the Semiparametric Bootstrap Method: An Application to Nias Megathrust Earthquake Data*
16.00 – 16.25	**Speaker 15: Dr. Adilan Widyawan Mahdiyasa** Institut Teknologi Bandung, **Indonesia** *A Calibrated Spatio-Temporal Machine Learning Model for Tropical Peatland Fire Risk*
16.25 – 16.30	**Closing**

**The tentative is subject to change.*

ONLINE ACCESS — ZOOM

Intelligent Medicine, Imperfect Evidence: Machine Learning and Deep Learning from Bench to Bedside

Abstract. Machine learning and deep learning have produced genuine clinical wins, yet remarkably few reach a patient. This talk asks three questions in order: what works, why so little translates, and what breaks methodologically. On what works, five deployed or externally evaluated systems are examined. A nationwide German mammography programme of 461,818 women raised cancer detection by 17.6% without increasing recall. Thailand's national diabetic retinopathy screening programme achieved 91.4% sensitivity for vision-threatening disease, exceeding retina over-readers. A chest CT model predicted lung cancer up to six years ahead and held its performance in a Taiwanese cohort. Against these sit a widely deployed proprietary sepsis model that, on external validation in 27,697 patients, achieved an AUC of 0.63, missed 67% of sepsis cases, and alerted on 18% of all admissions. On translation, the gap is structural, not mathematical. Of 81 deep learning studies benchmarked against clinicians, only six were tested in a real clinical environment and two were randomised, while 75% claimed clinician-comparable performance in the abstract. Device regulation designed for products that never change, absent reimbursement pathways, proprietary performance data, and workflows that reject a second screen each block deployment independently of model accuracy. On method, the failures are ones epidemiologists are equipped to catch: instability at small sample sizes that a rising C-statistic conceals, calibration failure that made a higher-AUC cardiovascular model treat nearly twice as many men, and shortcut learning so deeply embedded that models recover patient race from a 4×4-pixel radiograph. The talk closes with a practical checklist and argues that the region's comparative advantage lies not in compute but in external validation — which is epidemiology, and which we already do.

Keywords: Medical Imaging, Electronic Health Record, Area under Curve

Biography. Kamarul Imran Musa is a Professor of Epidemiology and Statistics and a medical epidemiologist at the School of Medical Sciences, Universiti Sains Malaysia (USM). He coordinates the Digital Health Unit within the School of Medical Sciences and serves as Research Coordinator for the Clinical and Health Science domain at USM. As a public health physician and Fellow of the American College of Epidemiology (FACE), he is the current President of the Malaysian Association of Epidemiology. Kamarul has

authored or co-authored over 200 research articles — indexed by SCOPUS — focusing on disease modelling, epidemiological and statistical methods, and the application of artificial intelligence in public health and healthcare. His work has received more than 130,000 citations (h-index 59), and he has been listed among the top 2% of the world's most cited researchers since 2021. His current research interests centre on epidemiological and statistical modelling as well as predictive and generative AI in public health, for disease surveillance, causal inference, risk prediction, and the use of AI tools in health research and practice. A strong advocate for R language and building AI literacy among public health professionals, he is committed to bridging the growing gap between AI advancement and the competencies of the public health workforce.

Clustering of Medical X-ray Images via Mixture of Kernel-Based Gaussian Copulas

Abstract. Clustering medical X-ray images is challenging because the images are high-dimensional and may exhibit substantial spatial and distributional variation. In this study, we develop a clustering method that represents an image through the distributions of pixel intensities in several spatial regions. Each image is divided into knon-overlapping regions. For each region, we construct the empirical cumulative distribution function (CDF) of the pixel intensities and evaluate it at a common set of intensity thresholds $Z1, \dots, Zn$. The resulting n×k CDF values provide a distributional representation of each image. We model these CDF values using a mixture of Gaussian copulas with Beta marginal distributions. The dependence between CDF values is described by a Gaussian copula whose correlation matrix is generated from an RBF kernel. The kernel incorporates both the intensity thresholds and the spatial locations of the corresponding regions. This construction reduces the number of parameters required to model the dependence structure, while allowing correlations to vary according to the distance between observations in the combined intensity-spatial domain. The parameters are estimated using a dynamical clustering procedure in which the cluster memberships and model parameters are updated iteratively by maximum likelihood. The method is evaluated using a dataset of Nchest X-ray images and is compared with K-means, and Gaussian mixture models. The results indicate that the proposed representation and copula-based dependence model can provide useful clusters while retaining information about the distribution of pixel intensities across spatial regions.

Keywords: mixture of copulas, Gaussian copula, image clustering, chest X-ray, dynamical clustering.

Biography. Prof. Sapto Wahyu Indratno is a Professor in Statistics at the Faculty of Mathematics and Natural Sciences, Institut Teknologi Bandung (ITB), Indonesia, and currently serves as Head of Data Analytics and Reporting at the ITB Strategic Planning and Risk Management Agency (BPSMR). He received his B.Sc. in Mathematics from ITB, an M.Sc. in Applied Mathematics from the University of Twente, the Netherlands, and an M.Sc. and Ph.D. in Mathematics from Kansas State University, USA. His research interests lie primarily in statistical and actuarial inverse problems, stochastic modeling, statistical learning, and risk analysis. His work includes inverse problems under uncertainty, Gaussian

processes, spatial and functional data analysis, and statistical methods for insurance and financial risk management. At ITB, he has held several academic and leadership positions, including Head of the Actuarial Science and Mathematics Master's Program, Head of the Statistics Research Group, and leadership roles in academic and student affairs. His professional experience spans mathematics, statistics, actuarial science, data analytics, and institutional strategic planning, providing a multidisciplinary perspective that connects methodological research with practical applications.

KEYNOTE SPEAKER 3

Predictive Analytics for Equipment Reliability in Oil and Gas *using AI Data-Driven Models*

Abstract. Equipment failure in oil and gas operations is costly and can create serious safety and environmental risks, yet data-driven prediction is still used mainly for isolated tasks. This keynote explains how AI data-driven models can turn plant and drilling data into early forecasts of equipment behaviour. It reviews the main data sources, machine learning and deep learning methods, and the practical barriers to adoption, including data quality, legacy systems, interpretability and validation. Case studies from CO_2 dehydration and drilling show how gradient boosting, LSTM networks and particle swarm optimization can be applied and compared. The talk closes with guidance on moving from a validated model to near/real-time monitoring and decision support.

Keywords: Predictive Analytics; Equipment Reliability; Oil and Gas; Machine Learning; Deep Learning

Biography. Professor Dr. Marina Yusoff is an AI lead researcher and academician at Universiti Teknologi MARA (UiTM), Malaysia, and currently serves as Deputy Director of the Institute for Big Data Analytics and Artificial Intelligence (IBDAAI). She holds a Ph.D. in Information Technology and Quantitative Sciences with a specialization in Intelligent Systems. She was a Senior Information Technology Executive at SIRIM Berhad, with earlier experience at HeiTech Padu Berhad under the Software Alliances programme with IBM. She is internationally recognized through appointments as Adjunct Associate Professor at Sohar University, Oman, Visiting Professor at L. N. Gumilev Eurasian National University, Kazakhstan and Visiting Professor at Universitas Brawijaya, Indonesia. Her research on Nature-Inspired Computational Optimization and its integration with advanced deep learning and machine learning include particle swarm optimization, genetic algorithms, ant colony optimization, the firefly algorithm, and cuckoo search. She has led 16 research grants (of 34 in total) worth over RM 14 million and produced more than 100 publications in indexed journals, proceedings, and books. A sought-after AI solution provider, trainer, and speaker worldwide, her applied research in healthcare, oil and gas, fintech, social media analytics, and intelligent system development.

Computer Vision and AI Algorithms in Solving Environmental Problems

Abstract. Red tides are abrupt increases in phytoplankton concentration that harm marine life and human health through seafood poisoning. Early detection is essential to mitigate ecological and economic damage. This study applies machine learning to predict red tide likelihood from biological water samples collected in the Sea of Japan and the Bering Sea. The dataset comprises 1,411 samples with environmental and biological features. Preprocessing included interpolation of missing values, One Hot Encoding, and normalization. Two approaches were employed: XGBoost gradient boosting for supervised regression of total algae biomass, and K-means++ clustering for unsupervised identification of environmental states associated with red tide risk. XGBoost achieved a coefficient of determination (R^2) of 0.74 and a mean absolute percentage error (MAPE) of 17.4%. K-means++ clustering, with the optimal number of clusters determined by the Elbow Method, revealed distinct groupings corresponding to high-risk, intermediate-risk, and low-risk conditions. Cluster 3 was characterized by extreme parameter values indicative of active or imminent red tide events, while Cluster 1 represented baseline low-risk conditions. The integration of supervised and unsupervised learning offers a foundation for operational forecasting tools and environmental monitoring strategies supporting early warning systems for harmful algal blooms.

Keywords: red tides, machine learning, XGBoost, K-means++, ecological forecasting

Biography. Tim Seleznev is Deputy Director of the Advanced Engineering School "Artificial Intelligence and Big Data" at Far Eastern Federal University (Vladivostok, Russia) and Head of the Laboratory of Robotics and Artificial Intelligence. He also serves as Director of the Mathematical Center. His research focuses on applying machine learning to environmental and industrial problems, including predicting harmful algal blooms and red tide events in the Sea of Japan and the Bering Sea. He actively collaborates with industrial partners on applied AI projects. His current work includes animal detection in agriculture, specifically chickens and pigs, as well as the development of AI agents for automation and decision support.

Computer Vision and AI Algorithms in Solving Environmental Problems

Sub-title: **Bridging Education and Industry: Teaching AI and Machine Learning Through Real-World Partner Projects from Year One**

Abstract: In the rapidly evolving landscape of AI and machine learning, traditional academic education often falls short of preparing competitive professionals. This presentation shares the successful experience of Far Eastern Federal University (FEFU) and the Far Eastern AI Center (a joint project with Sber) in integrating a highly practice-oriented approach into higher education. The core focus is our methodology for engaging first-year students in full-cycle commercial R&D commissioned by industry partners. The university environment creates a unique AI R&D ecosystem, combining access to interdisciplinary experts, in-house computing power, a broad partner network, and a pool of motivated young talent. Through real-world case studies, this talk illustrates how students are integrated into development cycles to solve complex business and state challenges.

Keywords: Artificial Intelligence, Machine Learning, Project-Based Learning, Industry Partnerships

Biography

Professor Roman Dremliuga holds a PhD in Cybercrimes and is Professor and Vice Dean at the Institute of Mathematics and Computer Science, Far Eastern Federal University (FEFU), Russia. He is the founder and head of the Far East Artificial Intelligence Center, established in collaboration with Sberbank, and previously led FEFU's Master's programme in Artificial Intelligence and Big Data. Professor Dremliuga has authored more than 50 publications in artificial intelligence, cybercrime, AI and law, and the societal implications of emerging technologies, as well as the popular science book Crime 4.0: Cybercrime Yesterday, Today, Tomorrow. He has led and participated in major national and international research projects on artificial intelligence, autonomous systems, virtual reality, and AI policy, including collaborations involving the Russian Foundation for Basic Research, APRU, and Google. His work reflects a strong interdisciplinary focus on the technological, legal, ethical, and societal dimensions of artificial intelligence.

From Patterns to Prediction: Transforming Dengue Data into Actionable Insights through Statistical and Machine Learning

Abstract. Dengue transmission emerges from interactions among environmental conditions, mosquito populations and human settlements, demanding analytical approaches that connect surveillance patterns with practical prevention. This presentation synthesizes applications of statistical analysis, geospatial modelling and machine learning across a multidisciplinary dengue research programme in Malaysia. Featured studies encompass spatiotemporal hotspot analysis, associations between microclimate and entomological indicators, predictive modelling, and drone-based environmental surveillance. Together, these applications illustrate a progression from identifying disease concentrations and examining environmental associations to predicting mosquito abundance and prioritizing potential breeding habitats. Statistical approaches support the assessment of temporal variation, correlated predictors and uncertainty, while machine learning provides complementary tools for modelling complex relationships within heterogeneous datasets. The synthesis emphasizes that human dengue notifications, mosquito abundance and habitat suitability represent distinct analytical targets requiring appropriate interpretation and validation. Spatial and temporal evaluation, prevention of information leakage, model interpretability and field verification are essential for establishing predictive credibility. Community acceptance and practical training further influence the translation of analytical outputs into surveillance activities. This presentation offers a transferable framework linking epidemiological data, environmental measurement and predictive analytics with targeted inspection and vector-control planning. Actionable insights depend on aligning model outputs with operational needs and demonstrating reliability under actual implementation conditions.

Keywords: Dengue surveillance; statistical learning; machine learning; spatial epidemiology

Biography. Prof. Dr. Nazri Che Dom is a professor at the Faculty of Health Sciences, Universiti Teknologi MARA (UiTM), Malaysia, specializing in applied entomology, environmental health and spatial epidemiology. His research integrates geographical information systems, remote sensing, statistical analysis and machine learning to investigate dengue transmission, mosquito ecology and environmental determinants of public health risks. His work connects epidemiological surveillance with fine-scale environmental measurements to support targeted vector control and evidence-informed decision-making. His research portfolio includes dengue hotspot mapping, microclimate-based predictive modelling, drone-assisted mosquito surveillance and community engagement in technology-enabled prevention. He also contributes to multidisciplinary research in environmental monitoring, occupational health and safety, and sustainable waste management. Prof. Dr. Nazri has led and contributed to numerous funded research projects and supervised postgraduate researchers across environmental health and related disciplines. His publications reflect a sustained commitment to translating analytical findings into practical approaches for surveillance and prevention. Through teaching, research mentorship and collaborative partnerships, he promotes the integration of scientific knowledge, emerging technologies and community perspectives to address complex public health challenges.

Explainable Deep Learning for Medical Image Diagnosis

Abstract. Deep learning has become the most widely published application of machine learning in medicine, with medical imaging now the leading clinical specialty for AI research. Convolutional and, more recently, transformer-based models routinely match or exceed expert performance in tasks such as detecting diabetic retinopathy, classifying tumours, and segmenting organs. Yet their adoption in real clinical practice remains limited by a single, decisive obstacle: these models behave as "black boxes," offering predictions without explanations that clinicians, patients, or regulators can trust. This talk examines how explainable AI (XAI) closes that gap. It reviews the statistical and machine-learning foundations of modern medical image analysis, then introduces the two dominant families of interpretability methods: post-hoc techniques such as Grad-CAM, SHAP, and LIME, and inherently interpretable model designs. This will be alongside uncertainty quantification, the natural bridge between classical statistics and deep learning. Through worked examples across radiology, pathology, and ophthalmology, the session shows how interpretability and calibrated confidence turn accurate predictions into clinically actionable, auditable decisions. It closes with the fastest-rising frontiers of 2025–2026, including multimodal vision-language foundation models that reason over images and text together, federated learning for privacy-preserving training across hospitals, and the open challenges of evaluation, fairness, and clinical translation.

Keywords: Explainable AI (XAI); Medical image analysis; Uncertainty quantification; Deep learning; Clinical decision support

Biography. Dr. Ramadan is a professor of Computer Science. He currently chairs the AI Applications Chair at the University of Nizwa. His research interests include Artificial Intelligence (AI), the Internet of Things (IoT), Mobile Computing, and Computational Intelligence. He received his master's and Ph.D. from Southern Methodist University (SMU), Dallas, Texas, USA. He has over 28 years of teaching and research experience. He also has industrial experience as the executive manager for software development companies for more than 10 years. He leads various research groups in IoT and Computational Intelligence. He has authored more than 140 journal and conference articles in AI, IoT, Sensor Networks, Mobile Computing, and Computational Intelligence. He also served as a general chair, co-chair, and TPC for several conferences and Journals.

Sparse Graph-Laplacian Non-negative Matrix Factorisation for Tumour Subtype Discovery from Copy Number Alteration Data

Abstract. Copy number alterations are genomic alterations that exhibit more or less copy number than the normal two copies. Different tumours can exhibit distinct patterns of CNA, therefore genome-wide CNA profiles provide a potentially informative basis for identifying previously unrecognised tumour subtypes. This is done by clustering and it musts address the main characteristics of CNA data: high dimensional, spatial dependence, feature selection, and interpretability simultaneously. We propose a sparse graph-Laplacian non-negative matrix factorisation method for joint dimension reduction and tumour clustering. The resulting matrix is approximated by the product of a patient exposure matrix and a genomic loading matrix. An L1 penalty on the loading matrix encourages sparse latent components, thereby identifying genomic regions that contribute to subtype separation. A graph-Laplacian penalty encourages regions connected through genomic proximity or empirical association to have similar latent loadings. The adjacency matrix can be constructed using correlation measures, with weak associations removed through thresholding. For prespecified graph threshold tau and penalty-mixing parameter alpha, the latent rank k and global penalty parameter lambda are selected by cross-validation. Estimation uses vectorised matrix operations, sparse graph representations, multiple initialisations, and parallel computation. A simulation study evaluates rank recovery, clustering accuracy, reconstruction error, and support recovery, with particular emphasis on sensitivity and specificity for identifying truly active genomic regions. The proposed framework aims to produce stable tumour clusters while retaining interpretable, spatially coherent CNA signatures.

Keywords: Clustering, non-negative matrix factorisation, cancer, tumour, subtype.

Biography. Arief Gusnanto obtained his PhD in Biostatistics from Karolinska Insitutet in Sweden in 2004, and joined the Medical Research Council-Biostatistics Unit in 2005 as postdoctoral research statistician. He joined the Department of Statistics, University of Leeds in 2007 as a lecturer and then as associate professor in 2017. His research focuses on statistical methodologies for high dimensional data and complex data that are commonly found in molecular biology, genomics and genetics, medicine, engineering, linguistics, chemistry, and finance.

Hybrid GSTAR and Deep Learning Model for Spatio–Temporal Air Pollution Forecasting

Abstract. Spatio-temporal data have two types of dependency at once, spatial dependency due to geographic proximity between locations and temporal dependency due to the influence of previous period values. The limitations of the Generalized Space-Time Autoregressive (GSTAR) model in capturing complex patterns have driven the development of hybrid models using deep learning. This study aims to develop GSTAR–ConvLSTM and GSTAR–GCN-LSTM hybrid models using a sequential approach, where the deep learning component corrects the GSTAR residuals. The implementation was carried out on PM2.5 air pollution data in Java Island, using both in-sample and forecast data. The results show that the GSTAR–ConvLSTM model performs better on in-sample data but is less stable in forecasting due to overfitting. In contrast, the GSTAR–GCN-LSTM model shows better generalization ability and was chosen as the best model. Overall, the performance of the hybrid models is affected by limited observations and data transformation, which can reduce important information for the deep learning component. When observation data is limited, the conventional GSTAR model tends to be more optimal. Conversely, as observation data increases, the hybrid models show increasingly optimal performance.

Keywords: GSTAR, ConvLSTM, GCN-LSTM, hybrid model, spatio-temporal data.

Biography. Dr. Utriweni Mukhaiyar is an Associate Professor of Mathematics Program and researcher of Statistics Research Division, Faculty of Mathematics and Natural Sciences, Institut Teknologi Bandung (ITB), Indonesia. She was the head of Doctoral and Master Programs in Mathematics of ITB in 2023 – 2025 and the head of the Quality Control of programs in Mathematics and Manager of Research and Innvoation in Faculty of Mathematics and Natural Sciences in 2022. She was actively lecturing in Institut Teknologi Sumatera (ITERA), Lampung Province of Indonesia and had role as Coordinator of Actuarial Science Study Program and be Advisor in Center for Research and Innovation of Prediction and Modelling of Hazards and Disaster Risks. Her doctoral research in statistics involved both theoretically development and application of space time analysis. It was applied for modelling the tea plantation's monthly production. In her research, she focused on the development of space-time modelling regarding the

construction of weight matrix and its stationary properties. Beside space-time analysis, she also does research in biostatistics, statistical process control, linear models, design of experiments, and multivariate analysis. Together with team of Statistics Research Division of ITB, she actively involved as statistics consultant for PT Astra Agro Lestari, Tbk., PT. Komatsu Indonesia, PT. Reasuransi Indonesia, Tbk., BPJS Ketenagakerjaan, and also gave many workshops for industries in various fields. She has more than 15 of government and university funded research projects as the principle investigator. From her research, she has published more than 75 Scopus indexed articles and papers in various well-known journals and presented papers at conferences both at home and abroad. Her works has more than 220 citations (H-Index 11). She also has been the invited speaker for intensive courses on space-time analysis and data analytics workshops and conferences in and out of the university, both national and international.

Deep Reinforcement Learning for Sustainable Cloud Resource Management: A Unified Perspective on Autoscaling, Task Scheduling and Simulation

Abstract. Cloud data centres must continuously balance resource efficiency, facility energy consumption and service performance. Two control decisions are central: how much computing capacity to keep active and where incoming tasks should execute. Deep reinforcement learning (DRL) can adapt these decisions to changing workloads, but reported results are difficult to compare because studies differ in state and action representations, reward formulation, workload models, energy boundaries, simulation environments and experimental scale. This keynote synthesises findings from a research programme connecting four dimensions of sustainable cloud resource management: sustainability measurement, DRL control design, simulation infrastructure and experimental evidence. It first draws on a specialised review to explain how controller-design choices influence reported performance. It then presents EETS, a proposed task scheduler that uses D3QN for action-value estimation and adds prioritised experience replay. Under the evaluated Alibaba Cluster Trace workloads, EETS produced lower response time and power consumption than the selected baselines, with its largest practical advantage at the 1,000-task-batch setting. The keynote next examines cooling-aware autoscaling, where facility energy includes both IT and cooling power, and Power Usage Effectiveness provides a facility-level measure. Two simulation platforms support the programme. Gym–CloudSim Plus connects Python-based DRL training with Java-based cloud simulation for autoscaling. Cloud_RL_Bench provides a common environment for comparing scheduling agents using matched workloads, resource settings and metrics. Its experiments show stable reward behaviour in a manageable setting but no clear convergence at the larger tested scale within the available training budget. Across the studies, sustainability claims require appropriate energy boundaries, rewards must reflect operational outcomes, simulation models must represent the effects being claimed, and small-scale success must be retested as workloads and action spaces grow. The keynote concludes with coordinated autoscaling and task scheduling as a future research direction.

Keywords: *Sustainable Cloud Resource Management; Deep Reinforcement Learning; Cloud Autoscaling; Cloud Task Scheduling; Cloud Simulation*

Biography. Assoc. Prof. Dr. Azlan Ismail is an Associate Professor in the Faculty of Computer and Mathematical Sciences at Universiti Teknologi MARA (UiTM), Shah Alam, Malaysia, and a Senior Research Fellow at UiTM's Institute for Big Data Analytics and Artificial Intelligence (IBDAAI). He earned his B.Sc. and M.Sc. in Computer Science from Universiti Teknologi Malaysia, completed his Ph.D. at the University of Wollongong, Australia, and conducted postdoctoral research in the Department of Computer Science at the University of Oxford, UK. Dr. Ismail's primary research expertise encompasses green cloud computing, deep reinforcement learning, big data analytics, resource provisioning, and formal verification. He has established a strong research track record as principal investigator and co-researcher for competitive national and international research grants, including the Fundamental Research Grant Scheme (FRGS) and Strategic Research Partnership (SRP) schemes under the Ministry of Higher Education Malaysia. An active innovator, he has won multiple gold and silver awards at the Invention, Innovation & Design Exposition. His work is extensively published in leading high-impact journals, including Future Generation Computer Systems, Expert Systems with Applications, The Journal of Systems and Software, and Simulation Modelling Practice and Theory.

Machine Learning in Disease Prediction: Fine-Scale Integrated Surveillance and Monitoring System

Abstract. The increasing burden of infectious and non-communicable diseases highlights the need for timely, intelligent, and fine-scale disease surveillance systems. Conventional surveillance approaches often rely on periodic reporting and aggregated data, which may limit the early identification of emerging disease patterns and localized risks. This keynote explores the application of Machine Learning (ML) in disease prediction and fine-scale integrated surveillance and monitoring to support early detection, risk assessment, and evidence-based public-health decision-making. The presentation focuses on an integrated, data-driven approach that combines heterogeneous sources, including clinical, demographic, environmental, epidemiological, and spatial-temporal data. Machine learning techniques such as classification, regression, ensemble learning, clustering, and deep learning can be applied to identify complex relationships between disease outcomes and associated risk factors. The overall approach includes data preprocessing, feature engineering, model development, validation, performance evaluation, and spatial-temporal risk analysis. The keynote will also highlight practical applications such as disease-risk mapping, early-warning systems, targeted surveillance, resource allocation, and timely intervention. Particular attention will be given to challenges related to data quality, privacy, model interpretability, bias, and real-world deployment. The integration of ML with epidemiological intelligence can enable more proactive, responsive, and data-driven disease surveillance and public-health management.

Keywords: Machine Learning; Disease Prediction; Integrated Surveillance; Spatial-Temporal Analysis; Public Health Monitoring

Biography. Dr. Monoj Kumar Muchahari is an Associate Professor and Associate Dean in the Faculty of Computer Technology at Assam down town University, Guwahati, Assam, India. He has more than 15 years of combined academic and industry experience and holds a Ph.D. in Computer Science and Engineering, with doctoral research focused on the selection of trustworthy cloud service providers. He was awarded the Rajiv Gandhi National Fellowship (RGNF) by the University Grants Commission (UGC), Government of

India, during his doctoral research. He also holds a Master of Computer Applications and has professional experience in software development. His research interests include Artificial Intelligence, Machine Learning, Deep Learning, Cloud Computing, Trust Management, Image Classification, Cybersecurity, and Intelligent Healthcare Systems. His research contributions encompass AI-driven healthcare data protection, hybrid deep learning for medical image analysis, malaria parasite detection, intelligent security architectures, trustworthy cloud service selection, and optimization-based image classification. Dr. Muchahari has published research articles in international journals and conferences and has contributed to edited books and book chapters with international publishers. He also serves as a reviewer for international journals and has contributed as a session chair, invited speaker, and organizer of academic and research programmes.

Conversational Physics: LLM-Guided Simulation for Non-Programmers

Abstract: Large Language Models (LLMs) are transforming how computational models and interactive learning environments can be developed, potentially lowering the programming barrier for users who want to explore complex physical and statistical phenomena. This work presents a research trajectory toward Conversational Physics, an approach in which natural-language interaction with LLMs supports the construction, refinement, and exploration of simulation-based models by non-programmers.

The talk brings together three complementary studies. The first examined the development of a Doppler-effect simulation through iterative prompt engineering, focusing on physics accuracy, sound-wave visualisation, and user interface and experience. The second extended the approach to electric-field simulation, introducing greater challenges in vector-based physics, numerical stability, dynamic visualisation, and interaction. Across both studies, iterative prompting enabled the development of functional and conceptually accurate web-based simulations, while expert verification remained essential for identifying implementation limitations and ensuring educational quality.

The third study demonstrates how computational physics can be integrated with statistical modelling to investigate one-on-one futsal goal-scoring probability. Using agent-based kinematics and shooting geometry, the model estimates Expected Goals (xG) by combining goal-angle projection with goalkeeper spatial occupancy. Variations in projectile velocity, reaction latency, and wingspan were analysed using simulation and sigmoid regression, revealing a critical response-time threshold of approximately 385 ms and systematic changes in goal-scoring probability.

Together, these studies illustrate a continuum from natural-language-driven simulation development to physics-based statistical inference. The keynote highlights the potential of LLMs to democratise computational modelling while emphasising the continuing role of human expertise in physical validation, statistical interpretation, numerical reliability, and research design. The broader significance lies in establishing conversational interfaces as a bridge between domain knowledge, simulation, and statistical analysis for researchers, educators, and non-programmers.

Keywords: Large Language Models (LLMs); Conversational Physics; Simulation; Statistical Modelling; Expected Goals (xG).

Biography

Dr. rer. nat. Sparisoma Viridi, is a physicist and senior academic at the Institut Teknologi Bandung (ITB), Indonesia, where he is a Associate Professor in Granular Physics and Fluid in the Nuclear Physics and Biophysics Research Group, Faculty of Mathematics and Natural Sciences. He earned his undergraduate and master's degrees in Physics from ITB in 1998 and 2001, respectively, and completed his doctoral degree at the University of Dortmund, Germany, in 2007. He has also undertaken international academic experience at TU Dortmund, including postdoctoral work in 2014 and three months visit to Osaka University in 2017.

His research interests encompass granular physics, computational physics, fluid dynamics, condensed-matter physics, and molecular-dynamics simulation, with expertise extending to computational modeling and interdisciplinary applications of physics. His research has contributed to the modeling of granular materials and particulate systems, including studies of compaction, the Brazil-nut effect, granular elasticity, and fluid–granular interactions. More recently, his work has expanded into multidisciplinary areas involving machine learning, bio- and medical physics, materials science, environmental modeling, and physics education. His publication record includes numerous journal articles and conference papers, with recent contributions addressing Raman spectroscopy, machine-learning-based materials research, agent-based modeling, and physics education.

Beyond the Architecture Race: Robust, Equitable Deep Learning for Brain Tumor Segmentation

Abstract. Accurate delineation of brain tumors on multiparametric MRI underpins diagnosis, surgical planning, radiotherapy and longitudinal monitoring. Over the past decade, deep learning has transformed this task from a labour-intensive manual process into one where automated methods rival expert performance. Yet the field has reached an important inflection point. Evidence from the BraTS challenges and recent benchmarking studies shows that leading architectures, from nnU-Net and MedNeXt to transformer and Mamba-based hybrids, now perform within narrow margins of one another. The next advances will come less from new network designs than from how models are trained, validated and deployed. This keynote traces that shift and examines the strategies behind recent winning solutions: synthetic tumor generation for data augmentation, lesion-aware ensembling, and model-agnostic post-processing. It also examines the move toward clinically meaningful evaluation through lesion-wise metrics. The talk then addresses a persistent gap. Most models are trained on relatively homogeneous, high-resource datasets and often degrade on lower-quality or low-field MRI common in many low- and middle-income settings. Drawing on the BraTS Sub-Saharan Africa experience, it considers how transfer learning, targeted augmentation and topology-aware refinement can narrow this gap. The keynote concludes with a research and implementation agenda built on three priorities: rigorous validation, representative data, and clinical integration. The aim is to ensure that advances in brain tumor segmentation deliver benefit to patients wherever they are treated.

Keywords: deep learning, brain tumor segmentation, BraTS, MRI, generalisation, global health AI.

Biography. Dr Tirivangani Magadza is Director of the Centre for Artificial Intelligence (CAI) at the Harare Institute of Technology (HIT), Zimbabwe. He is a registered Professional Engineer (Pr. Eng.) and a professional member of Computer Zimbabwe. He holds a PhD in Computer Science from the University of KwaZulu-Natal, South Africa, a Master of Technology in Computer Science from Jawaharlal Nehru Technological University Hyderabad, India, and a Bachelor of Technology in Computer Science from HIT. His research spans machine learning, computer vision, natural language processing and

embedded systems, with a particular focus on medical image analysis. He is lead author of Deep Learning for Brain Tumor Segmentation: A Survey of State-of-the-Art (Journal of Imaging, 2021) and Efficient nnU-Net for Brain Tumor Segmentation (IEEE Access, 2023). At CAI, he leads multidisciplinary applied research in climate-health early warning, satellite-enabled smart agriculture, and AI for Shona and Ndebele speakers, and supervises postgraduate research. He was recently co-opted to the Parliament of Zimbabwe's Committee of the Future, which embeds foresight and long-term strategic planning in parliamentary processes. He advocates for democratising AI through rigorously validated, locally owned solutions for resource-constrained settings.

3D Anisotropic Semivariogram Modeling Using the Semiparametric Bootstrap Method: An Application to Nias Megathrust Earthquake Data

Abstract. The 2005 Nias earthquake was a megathrust event with a main magnitude of 8,6, accompanied by numerous aftershocks and causing widespread impacts in the surrounding region. This event is a relevant case study for analyzing the spatial distribution patterns of its magnitude. This thesis aims to model the spatial distribution of earthquake magnitude using a three-dimensional (3D) anisotropic semivariogram approach, as well as to evaluate the effect of applying the Semiparametric Bootstrap (SPB) method on the prediction accuracy of interpolation results using the Ordinary Kriging (OK) method. The experimental semivariogram was calculated based on point pairs in each dip-direction sector, with the distance class width modified to be half of Scott's rule to increase the number of lags, particularly in the 45° and 90° dip sectors. However, the 90° dip sector still produced a limited number of lags and was therefore excluded from further modeling. Theoretical semivariogram modeling was carried out using the Weighted Least Squares (WLS) approach and the Nelder–Mead optimization algorithm. Most sectors indicated that the Gaussian model yielded the lowest objective function value compared to other models and was therefore selected as the basis for constructing the 3D anisotropic semivariogram. The final model had a mixed zonal form combining the 0° dip sector (a combination of isotropic and geometric components) and the 45° dip sector (a combination of isotropic and zonal components), with weighting based on range. Data replication was performed using the SPB method to generate bootstrap experimental semivariograms, which were then refitted. The best-fitting model after applying SPB was of the spherical type. Both theoretical models were used for spatial interpolation via the OK method and evaluated using the Mean Absolute Error (MAE). Evaluation results showed that the SPB-based model produced a lower MAE value, leading to the conclusion that the SPB method improves the stability and accuracy of spatial earthquake magnitude predictions.

Keywords: Anisotropy, Semivariogram, 3 Dimentional, Megathrust earthquake, Semiparametric Bootstrap.

Biography. Dr. Kurnia Novita Sari, S.Si., M.Si is a lecturer in the Mathematics and Actuarial Science Study Programs at the Faculty of Mathematics and Natural Sciences, Bandung Institute of Technology (ITB), Indonesia. She earned her Bachelor's, Master's, and

Doctoral degrees in Mathematics from ITB. Her research interests include spatial statistics and geostatistics, particularly semivariogram and kriging modeling, as well as actuarial science, with a focus on mortality and morbidity table. Her research has been applied in various fields, including agriculture, mining, education, and life insurance. She has published research on 3D anisotropic semivariogram modeling, multiple-life and multiple-decrement models, and Indonesian mortality and morbidity tables. She is also actively involved as a speaker in national and international seminars and workshops, including workshops on geostatistics and morbidity tables.

A Calibrated Spatio-Temporal Machine Learning Model for Tropical Peatland Fire Risk

Abstract. Tropical peatland fires are complex environmental hazards with significant impacts. However, existing fire risk approaches, including empirical drought-fire indices and machine learning models that focus on either spatial or temporal aspects, remain limited in representing the dynamics of fire occurrence across heterogeneous peatland landscapes. Here, we develop an integrated spatio-temporal machine learning model with a probabilistic calibration method to analyze and predict tropical peatland fire risk. The framework employs a Convolutional Neural Network (CNN) to extract spatial features, Convolutional Long Short-Term Memory (ConvLSTM) to capture temporal dependencies, and isotonic regression to calibrate predicted fire probabilities. We employ meteorological, hydrological, land cover, anthropogenic, and historical fire data from tropical peatlands in Kalimantan, Indonesia. The proposed model achieves good performance and produces probability of fire maps that are consistent with observed fire hotspot distributions. Furthermore, the forecasting results show that the model can identify shifting fire risk patterns across peatland areas over different time horizons. These findings demonstrate that the proposed framework provides not only a predictive tool but also actionable information for early warning, risk assessment, and fire mitigation in tropical peatland ecosystems.

Keywords: Tropical peatland, Fire risk, Spatio-temporal model, Probability of fire, Machine learning model

Biography. Adilan Widyawan Mahdiyasa, Ph.D., is a Lecturer at the Institut Teknologi Bandung (ITB), Indonesia, with expertise in mathematical modelling, stochastic modelling, computational methods, and tropical peatland systems. He obtained his bachelor's and master's degrees from Institut Teknologi Bandung and completed his Ph.D. at the University of Nottingham, United Kingdom, specializing in mathematics and stochastic modelling. His research focuses on the integration of mathematical, statistical, physics-based, and machine-learning approaches for understanding tropical peatland dynamics, including peatland stability, ecohydrological processes, carbon accumulation, groundwater behaviour, and fire-risk prediction. His recent research has

resulted in publications in *Scientific Reports*, *Natural Hazards Research*, *Ecological Informatics*, *Earth Surface Dynamics*, *Environmental Sciences Europe*, *Ecological Modelling*, and *Ecohydrology*. He is also the lead developer of Peatfr, an R package designed to forecast tropical peatland fire risk using stochastic, machine-learning, and optimisation methods. His multidisciplinary and international experience includes research collaborations and scientific presentations in Indonesia, the United Kingdom, Scotland, and international forums such as EGU and UKACM.
